

Preparing for a VPS Reinstall

Version 1.0.0 | Updated 2026-09-05 | 1 min read

Preparation / invited access

In this guide: [Before you start](#) | [Steps](#) | [Verify the result](#) | [Help and related information](#)

A reinstall replaces the operating-system disk and may erase data. This guide prepares the decision; it does not authorize destruction.

Before you start

Use the access and features actually assigned to your account. Keep a rollback or recovery route before changing existing service settings.

Steps

1. Inventory application data, configuration, credentials and attached volumes.
2. Make an independent backup and prove an isolated restore.
3. Record the exact target instance and explicitly confirm the data-loss scope with its owner.
4. After an authorized reinstall, verify fresh machine identity, SSH host keys, network settings and restored application behavior.

Verify the result

The owner accepted the exact target and a usable backup exists before reinstall begins. Stop if either condition is missing.

Help and related information

Contact support, service status, and Customer Access. Never send passwords or recovery codes.
