Password exports may contain readable secrets. Handle them only in a protected local workflow.

Before you start

Use the access and features actually assigned to your account. Keep a rollback or recovery route before changing existing service settings.

Steps

1. Confirm the supported import format in the actual vault client.
2. Keep the source vault intact and export only in a private protected location.
3. Import into the correct account, then verify representative entries without copying secrets into diagnostics.
4. Remove temporary plaintext exports using the approved retention procedure after verification; retain a protected recovery source.

Verify the result

Required entries and fields are present and accessible. A successful import message alone does not verify every item.
